

# AI-costing

Are you still doing product costing manually?

Isn't it time to use Artificial Intelligence for this?

In sourcing a collection, it is imperative that the products deliver the required margins. At the moment this is pure guesswork and lead to many last-minute unpleasant surprises.

It is now time to use the power of Artificial Intelligence to get a good idea of the actual costs involved. Fast and easy costing to enable good decisions.

## 3 SIMPLE STEPS

- Select production cities, delivery terms (FOB/CIF), currency
- Drag-drop article picture of techpacks
- Output for detailed costing for each of the selected cities

Currently too much time is wasted in estimating costing of a product. Typically a merchandiser looks for a similar product, then makes several phone calls to estimate the costing.

Using AI-Costing this process can be greatly speeded up. Also an estimate can be made for production in any city. The system can also match the output with your standard fabric and trims libraries.
